Site: 20 sq km / 4,942 acres

For Xintang, the design opportunity is found in its most fundamental landscape elements: the river, lakes and hills. These natural elements are rooted in the history of the area and capture its true meaning. Our inspiration for the plan uses these natural landscape elements as a framework for growth.

Our framework begins with a green network as the central organizing element. A proposed series of riverfront parks is the first step for creating a community-wide open space system that fosters connections between the site's assets along the river. The riverfront park extends outward with green corridors that establish the framework around which clusters of residential and commercial development will occur.
