This multi-functional business park and open space project focuses on a comprehensive wetland ecological system intended to foster green business opportunities, introduce an eco-friendly way of life to city dwellers, and create a service-oriented wetland development that balances environmental protection and resource utilization. The project includes four major zones for wetlands, agriculture, business park, and reserved land, with special features of a wetland tech park, agricultural demonstration fields, creative workshops, and a residential village.

SWA’s design emphasized the idea of “habitat return”, which encompasses not only wildlife habitat restoration but also an understanding of the area’s human settlement origins. The unique wetland settlements scattered between lakes, woods, and fields provide a pattern for eco-corridors and new leisure experiences that reflect the historical Jiading landscape aesthetic.
